## Lull in the upswing?

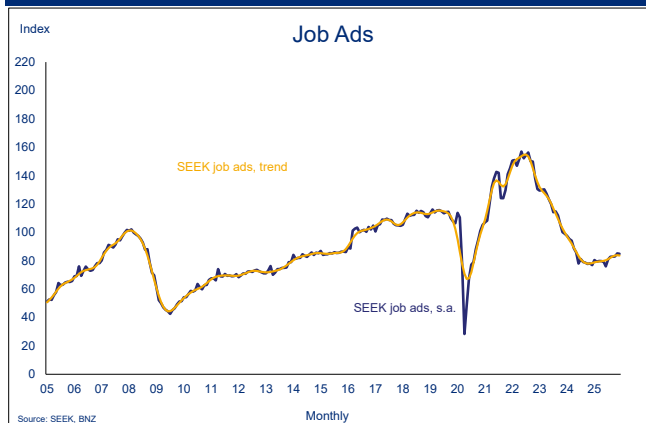

- **Job ads flatten into end of 2025**
- **But still up on a year ago**
- **Significant variation across industries**
- **Hiring intentions positive**

	Dec-23	Dec-24	Oct-25	Nov-25	Dec-25
m/m % change	-2.9	0.4	0.8	0.3	-0.3
m/m % change (s.a.)	-1.2	-1.6	0.1	2.6	-0.3
3m/3m	-9.2	-1.9	3.1	2.9	2.0
Ann % change (m/m)	-26.3	-21.4	7.3	7.5	6.7
Ann % change (3m/3m)	-26.6	-24.0	5.5	6.9	7.2

All data is the trend unless otherwise indicated

The upswing in SEEK job ads saw a hint of stalling into the end of 2025. After 13 consecutive monthly gains on a trend basis, job ads eased 0.3% in December. This unwound November's gain. Latest trend estimates can get revised, so interpretation requires some caution. But the hint of a flattening trend at a still relatively low level is important to monitor. If it were to continue, it would raise downside risks to forecasts of employment growth ahead.

### A hint of stalling?

Annual job ad comparisons offer more encouragement. Looking through the latest monthly wriggles, jobs ads remain firmly higher than a year ago.

We remain of the view that employment will lift in 2026. NZIER's latest Quarterly Survey of Business Opinion (QSBO) contained some positive signals for the labour market, including a net 15% of firms saying they intend to take on more staff over the coming three months.

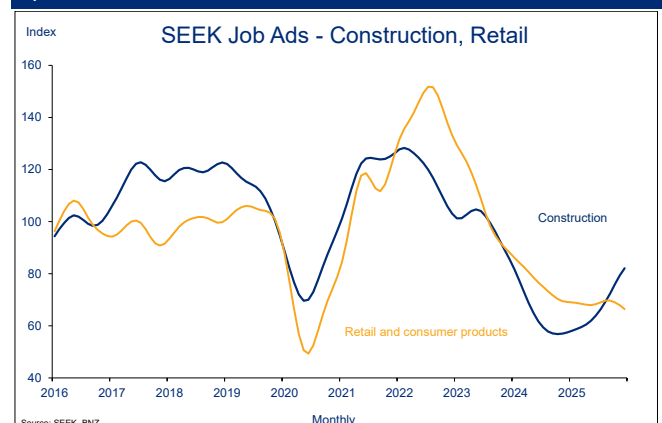

That said, we continue to worry that as demand for labour begins to rise businesses will encounter a mismatch in the skills needed with the skills of the unemployed. Indeed, there was already a scent of that occurring through 2025 with the unemployment rate edging higher despite a lift in jobs ads. Indeed, in the QSBO, a net 2% of firms reported it had becoming increasingly difficult to find skilled labour.

Job ad comparisons to a year earlier shows significant variation in the detail. There is clear improvement in industries related to the building cycle and primary sector reflecting increasing residential building activity and strong primary sector exports.

Construction job ads led the charge higher over 2025 with a 42.9% y/y increase, while Farming, Animals & Conservation job ads rose 23.7% y/y. There were also strong gains in Engineering (17.6%), Trades & Services (14.0%), and Manufacturing, Transport & Logistics (12.2%).

In contrast, industries more aligned to consumer spending remained subdued. Retail & Consumer Product job ads fell 4.0% y/y and Hospitality & Tourism job ads eased 1.8% y/y. Sales job ads managed to edge up 1.0% y/y.

### Ups and downs

We expect the labour market to lag the broader economic recovery, but through the mix of employment indicators we sense some underlying improvement is underway. This thesis was supported by a 0.3% m/m gain in filled jobs in the recently released data for November. This, in turn, is consistent with our forecast that official HLFS employment will post a mild gain in Q4 when that data is released on 4 February.

**SEEK Disclaimer:** Data is provided by SEEK and includes the SEEK Employment Index (SEI). All data is trend unless otherwise stated. The Data should be viewed and regarded as standalone information and should not be aggregated with any other information. The Data is provided in summary form and while care has been taken in its preparation, SEEK makes no representations whatsoever as to its completeness or accuracy. SEEK expressly bears no responsibility or liability for reliance placed by you on the Data or from the use of the Data by you. The SEI measures only new job ads posted within the reported month to provide a clean measure of demand for labour across all classifications. The SEI may differ to the job ad count on SEEK's website due to a number of factors including: 1) seasonal adjustments applied to the SEI; 2) the exclusion of duplicated job ads from the SEI.

The Covid-19 pandemic led to a high level of volatility in labour market data between April 2020 and March 2022. As a result, caution is recommended when interpreting trend estimates during this period as large month-to-month changes in variables generated multiple trend breaks.

The applications per ad index contains a series break at Jan 2016 when the calculation of this series changed from using gross variables (inclusive of all SEEK job listings) to net variables (removing duplicate job listings). This change has a negligible impact on recent data points, but caution is recommended when interpreting data immediately following the series break, and particularly in 2016 where growth rates have not been adjusted for the series break.
